

EMPATHIA TECHNOLOGIES

# IT Onboarding Success Guide

Ninety days from an account and a desk to independent in the core of the role: the programme by phase, the checks along the way, and what good looks like at 30, 60 and 90 days.

**Employee edition**
The new starter

**Administrator edition**
The person who publishes the guide for the organisation

DRAFT Synthetic demonstration

Northstar edition · 13 November 2026

# How this programme works

The programme is the same for every organisation. Everything about one organisation (who the manager is, which site, which contacts) is read from that organisation's own records when the guide is opened, and a field it has not provided is shown as not recorded, never filled in.

**01 · Before day one**
The two weeks before the start date
The new starter arrives to a desk, an account and a plan, not to a wait.

**02 · First day**
Day 1
Signed in, safe, and clear on who to ask.

**03 · First week**
Days 2 to 5
Knows the site, the support model and how a job moves.

**04 · First month**
Days 6 to 30
Takes a job from assignment to restored with someone watching.

**05 · By day 60**
Days 31 to 60
Handles ordinary jobs alone and keeps people told.

**06 · By day 90**
Days 61 to 90
Independent in the core of the role, and able to show someone else.

## This edition

| **Organisational content approved by HR** | *Not recorded. The organisation's administrator provides it; none is recorded in this demonstration.* |

# 00

# The rooms you will look after

Atlas HQ: 43 rooms on record. Every room has one record: its equipment, its history and its evidence, the same in every view.

A floor on the campus map: room footprints are their modelled dimensions, and a room's glyph counts its open issues.

Atlas 4.218 — Executive Boardroom in Lite, drawn from its record. Positions are as designed or modelled, not surveyed.

## Meeting rooms: what is in one, and what each part does

*Five things, in most rooms. Knowing which is which tells you what to check.*

**The parts.**

- The display shows the far end and whatever is being shared.
- The camera sends the room to the far end. If it follows people or frames the table by itself, leave it to do so.
- The microphones are often in the ceiling or on the table. They hear the whole room, including side conversations and crisp packets.
- The loudspeakers play the far end. If people in the room cannot hear, it is the room's volume, not your laptop's.
- The touch panel asks the room to do things. It is the remote control; it is not where the picture or the sound is made.

**Rooms differ.**

- A small room may have one bar under the screen that is the camera, the microphones and the loudspeakers in one.
- A large room may have several screens, several cameras and a lectern. Its own page says what it has.
- A room that joins the meeting by itself needs no laptop at all: you press Join on its panel.

You can see a display, a camera, 2 ceiling microphones, 2 loudspeakers and a touch panel. Behind them, 4 more kinds of equipment do the processing and the networking.

A room’s equipment by kind, on its room-guide page. A class of device, never a make or model.

# 01

# Before day one

The two weeks before the start date. The new starter arrives to a desk, an account and a plan, not to a wait.

do **Confirm the start date, the site and the working hours**

The manager · confirmed by manager

The first message a new starter gets should answer where, when and who meets them.

do **Ask for accounts and access, and confirm they are ready**

The manager · confirmed by manager · needs the organisation's access

A first day spent waiting for an account teaches the wrong thing about the organisation.

- Each request names the person, the role and the least access that role needs
- Ready means tested by someone, not merely approved

do **Assign equipment and a place to work**

The manager · confirmed by manager · needs the organisation's equipment

Equipment that arrives in week two is a week of borrowing.

do **Name a mentor and put the first-week meetings in the calendar**

The manager · confirmed by manager

A mentor chosen before day one has time to prepare.

learn **Read what the first week holds**

The new starter · confirmed by self

Nobody should have to guess what Monday is.

# 02
# First day

Day 1. Signed in, safe, and clear on who to ask.

meet **Meet your manager: what the first thirty days are for**

The new starter · confirmed by self

Agree what “going well” means before anything is measured.

do **Sign in, set up your second sign-in factor, and check you can reach what you were given**

The new starter · confirmed by self

Find what is missing on day one, while it is nobody’s emergency.

- Signed in on the equipment assigned to you, not a borrowed session
- Anything you cannot reach is reported the same day, with what you tried

learn **Security basics: what you never do with a credential**

The new starter · confirmed by check · knowledge check security

Support staff are asked for access every day; the habit has to be there before the first request.

learn **How support works here: who reports, who triages, who visits, who decides**

The new starter · confirmed by self

Most early mistakes are doing someone else’s part.

meet **Meet your mentor**

The new starter · confirmed by mentor

The person you ask the questions you think are too small.

# 03
# First week

Days 2 to 5. Knows the site, the support model and how a job moves.

learn **Service management: a job from report to verified fix**
The new starter · confirmed by check · knowledge check service
Every job has a state, an owner and a record; knowing them is the job.

do **Walk your site and find every room you will look after**
The new starter · confirmed by self
A room you have stood in is a room you can picture when someone calls about it.

learn **How a meeting room works: display, camera, microphones, processor, control**
The new starter · confirmed by check · knowledge check room
Faults make sense once you know what each part is for.

learn **The systems and tools you will use, and what each is for**
The new starter · confirmed by self · needs the organisation's software
One tool for the record, one for talking, one for monitoring: know which is which.

exercise **Shadow a visit: your mentor shows a first-response check in a room**
The mentor · confirmed by mentor
Watch the order someone experienced works in before forming your own.

- The mentor says what they are checking and why, as they go
- The starter can repeat the order of the check afterwards

learn **Network fundamentals for rooms: addresses, switch ports, and what "offline" can mean**
The new starter · confirmed by check · knowledge check network
"Offline" is a symptom with several causes, and only some are yours to fix.

learn **Where things are written down: the room's record, its guide, and its commissioning documents**
The new starter · confirmed by self
The answer is often already written; know where to look first.

learn **Escalation: when to hand on, to whom, and what to write**
The new starter · confirmed by check · knowledge check escalation
A good hand-on saves the next person from starting again.

meet **Meet the site champion of your site**

The new starter · confirmed by self

They know the rooms and the people; they will be the first to tell you something is wrong.

---

review **End of the first week: a short conversation, nothing scored**

The manager · confirmed by manager

The cheapest moment to fix a missing account, a wrong assumption or a worry.

---

# 04
# First month

Days 6 to 30. Takes a job from assignment to restored with someone watching.

exercise **Take a job from assignment to restored, with your mentor watching**

The new starter · confirmed by mentor

The first one done properly sets the pattern for the rest.

- Read the job and the room's record before going
- Said what was seen before saying what was wrong
- Wrote what was done so that someone else could repeat it
- Checked with the person affected before calling it restored

learn **Communication: what to say to the person in the room, and what to write on the job**

The new starter · confirmed by check · knowledge check communication

People forgive a fault sooner than they forgive not being told.

learn **Engineering standards: what a standard is, where this organisation keeps its own, and what an exception needs**

The new starter · confirmed by self · needs the organisation's standards

A standard is why two rooms behave the same; an exception is a decision someone signed.

learn **Vendors: who supports what at your site, and how a vendor visit is arranged**

The new starter · confirmed by self · needs the organisation's vendors

Some repairs are someone else's under an agreement; doing them yourself can void it.

do **Write up one fix so the next person can use it**

The new starter · confirmed by self

What you learned this month is worth more written down than remembered.

- Names the symptom as a user would describe it
- Says what was checked, in order, and what was found
- Contains no password, no personal detail and nothing that identifies a person

review **Thirty-day review**

The manager · confirmed by manager

Compare the month with what was agreed on day one, and agree the next thirty days.

# 05

## By day 60

Days 31 to 60. Handles ordinary jobs alone and keeps people told.

exercise **Handle a job alone; your mentor reads the record afterwards**

The new starter · confirmed by mentor

Independence is shown by the record, not claimed.

- The record alone tells the mentor what happened
- Anything outside the role was handed on, with what had been tried

learn **Stakeholders: who feels a room's failure most, and how to keep them told**

The new starter · confirmed by self

The person who booked the room and the person who presents in it are rarely the one who reports the fault.

do **Check a room is ready before an important meeting**

The new starter · confirmed by self

Ten minutes before is when a fault costs nothing.

do **Choose one thing to get better at, with your manager**

The new starter · confirmed by manager

One named skill with a date beats a list.

review **Sixty-day review**

The manager · confirmed by manager

Is the starter handling ordinary jobs alone, and are people being kept told?

# 06

# By day 90

Days 61 to 90. Independent in the core of the role, and able to show someone else.

exercise **Show someone else: take a newer colleague or the site champion through one check**

The new starter · confirmed by mentor

Explaining a check is the proof of understanding it.

- Explained what each step is for, not only what to press
- Said where the check stops and a report begins

learn **Certification pathways: what the organisation asks of your role, and what is optional**

The new starter · confirmed by self · needs the organisation's training

Know which learning is required, which is supported, and which is your own choice.

review **Ninety-day review**

The manager · confirmed by manager

Independent in the core of the role? Agree what the next quarter is for.

# 07

# What good looks like at 30, 60 and 90 days

| Competency | Day 30 · Day 60 · Day 90 |
|---|---|
| **Keeps the record** | **30:** Every job they touch says what was seen and done<br>**60:** Their records can be followed by someone who was not there<br>**90:** Their write-ups are used by others |
| **Works a fault in order** | **30:** Follows a first-response check with help<br>**60:** Works ordinary faults alone, in a sensible order<br>**90:** Explains their order to someone else |
| **Hands on well** | **30:** Knows who each kind of problem goes to<br>**60:** Hands on early, with what was tried<br>**90:** Rarely has a hand-on sent back for more detail |
| **Keeps people told** | **30:** Tells the person affected what is happening<br>**60:** Gives a clear answer when a fix will not be in time<br>**90:** Is asked for by name |
| **Works safely and within the role** | **30:** Knows what the role does not do<br>**60:** Stops and asks when a job leaves the role<br>**90:** Shows others where the role stops |

Ratings are “Not yet”, “With help”, “Independently”. A rating is a manager’s judgement recorded with its evidence; it grants no authority on its own.

Examples of professional pathways a person may choose to pursue: CTS (AVIXA), CAPM (PMI), CompTIA Network+. Naming a pathway is not a requirement and implies no endorsement.

# 08
# Knowledge checks

Each check, then the answers with why, at the end of this section.

### Security basics

1. A senior colleague phones and asks you to read out a one-time sign-in code so they can “get in quickly”. What do you do?
   a. Read it out: they are senior
   b. Send it by message instead, so there is a record
   c. Decline, and report the request the way your organisation asks you to
2. You find a password written on a note stuck to a room’s equipment. What is the right first step?
   a. Report it, so the credential is changed
   b. Take the note away and say nothing
   c. Use it to check that it still works

### A job from report to verified fix

1. You restore a room’s sound. When is the job finished?
   a. When the sound comes back
   b. When it has been checked and the record says what was done
   c. When you leave the room
2. Someone stops you in a corridor and describes a fault. What makes it a job?
   a. Recording it, with the room and what they saw
   b. Fixing it straight away
   c. Remembering to mention it at the next meeting

### How a meeting room works

1. People in the room can hear the far end, but the far end cannot hear the room. Which part of the room is the first to look at?
   a. The loudspeakers
   b. The microphones, and whether the room is muted
   c. The display
2. What does a room’s touch panel do?
   a. It produces the picture and the sound
   b. It stores the meeting
   c. It sends requests to the equipment that does the work

### Network fundamentals for rooms

1. A device shows as “offline” in monitoring. What does that tell you for certain?
   a. Only that monitoring could not reach it
   b. That the device has failed
   c. That the room cannot be used
2. You think a room’s fault is in the network switch. What is yours to do?
   a. Change the switch port’s settings to test the idea
   b. Hand it on with what you saw, to the people who run the network
   c. Restart the switch

## Escalation

1. Which hand-on helps the next person most?
   a. “Not working, please look”
   b. “Probably the processor”
   c. “No picture since nine. Cable and input checked, no change. Panel shows the source as connected.”
2. When is the right time to hand a job on?
   a. Only when you have run out of ideas
   b. As soon as the fix is outside your role, or the time it is costing is more than the room can bear
   c. Never: finishing your own jobs is the point

## Communication

1. A meeting starts in five minutes and you cannot fix the room in time. What do you say?
   a. What does not work, what still does, and where they can go instead
   b. “Give me two minutes” and keep trying
   c. Nothing until it is fixed
2. What belongs in the note you leave on a job?
   a. Who you think caused it
   b. What you saw, what you did, and what state you left the room in
   c. As little as possible

## Answers

### Security basics

1. **c** — A sign-in code is for the person it was sent to. Nobody in support needs yours, and a request that leans on seniority and hurry is how these attacks are made.
2. **a** — A credential in plain sight is exposed whether or not anyone has used it. It is reported so that it can be changed; removing the note alone leaves the same password in place.

### A job from report to verified fix

1. **b** — Restored is what you believe; verified is what the person affected, or a check, confirms. The record keeps the two apart on purpose.
2. **a** — A fault that is only spoken has no owner, no state and no history. Recording it is what lets someone else pick it up.

### How a meeting room works

1. **b** — Sound travelling out starts at the microphones and their mute state. The loudspeakers are working: the room hears the far end.
2. **c** — The panel asks; other equipment does the work. A panel that responds does not prove the equipment behind it did.

### Network fundamentals for rooms

1. **a** — Monitoring reports what it could reach. The device may be off, unplugged, on the wrong network or working with its reporting blocked; the room has to be looked at.
2. **b** — A switch serves more than one room, and changing it is the network team's decision. What helps them is the evidence: which port, what you saw, and when.

### Escalation

1. **c** — What was seen, what was tried and what changed lets the next person start where you stopped.
2. **b** — A hand-on is part of doing the job well. Waiting until every idea is exhausted costs the people waiting for the room.

### Communication

1. **a** — People can plan around a clear answer. They cannot plan around hope.
2. **b** — The record is read by someone who was not there. Facts in order serve them; blame and guesses do not.

## Empathia Technologies

Onboarding that starts before day one and ends with someone able to show the next person.

This booklet was set from the Living Campus demonstration on 13 November 2026. Every room, person and organisation in it is synthetic. It is a DRAFT: written by the demonstration’s engineer from the founder’s list of contents and not yet reviewed by a practising specialist. An organisation’s own edition replaces the generic wording with its approved instructions.

Names of other companies’ products are used only to say which is which; no instruction for another company’s application is written here.
